By deploying our face detection application on Docker cluster, we will try to achieve high throughput by parallelizing processing of images for head count task on multiple nodes each having thousand of pictures. © 2017 <https://creativecommons.org/licenses/>. 1. INTRODUCTION

Counting the number of people in a image has been a challenge in the field of computer vision [1]. Given a huge number of images, finding the number of people in each image can become a cumbersome task. We try to solve this issue using our distributed approach using a docker swarm cluster which is a cluster of Docker [2] engines, or nodes, where services have to be deployed. We run the OpenCV [3] face detection algorithms on smaller data in multiple nodes and obtain the head count of the people in each picture.

ACKNOWLEDGEMENTS

This project is undertaken as part of I524: Big Data And Open Source Software Projects at Indiana University, Bloomington. We would like to Prof. Gregor von Laszewski and Associate Instructors for their help.
